Summary

The Global Adult Tobacco Survey (GATS), a component of Global Tobacco Surveillance System (GTSS), is a global standard for systematically monitoring adult tobacco use and tracking key tobacco control indicators. GATS is a nationally representative household survey of adults 15 years of age or older using a standard core questionnaire, sample design, and data collection and management procedures that were reviewed and approved by international experts. GATS is intended to enhance the capacity of countries to design, implement and evaluate tobacco control interventions.

GATS is designed to produce national and sub-national estimates among adults across countries. The target population includes all non-institutionalized men and women 15 years of age or older who consider the country to be their usual place of residence. All members of the target population are sampled from the household that is their usual place of residence. All GATS countries use country-specific stratified multi-stage cluster sampling designs and an interview consisting of a household screening component and an individual component administered to the selected respondent. Data are collected using electronic handheld devices.

GATS Qatar was conducted in 2013 using a multistage stratified cluster sample design. The sample size was 8,571 selected households with 8,398 completed individual interviews. The GATS Qatar questionnaire included core questions about background characteristics, tobacco smoking, smokeless tobacco, cessation, secondhand smoke, economics, media, and knowledge, attitudes and perceptions, along with country-specific questions on waterpipe use and electronic cigarette use. Questions were adapted in each section, then reviewed and approved by a questionnaire expert review committee. The questionnaire was administered using a software program developed by RTI International for electronic data collection using handheld computers.

Personally-identifying information has been removed from this data file to protect confidentiality. Due to the complex sample design, clustering, stratification and sample weights should be taken into account in data analysis in order to obtain proper point estimates and variances. The stratification, cluster and sample weight variables are gatsstrata, gatscluster and gatsweight, respectively.
